

Integration of 3rd Party Software and Applications with ChipNet3

Description

ChipNet3 has been structured so that software developers can easily integrate ChipNet3 with existing payroll, stock control and administration software installations. Developers can also use the ChipNet3 SDK tools to develop their own satellite applications.

If required, the contact smartchip can be embedded into access control proximity cards, providing a very powerful multi-application tool.

Our vision is that ChipNet3 shall be inherently upgradeable and essentially independent of future card technology, with the goal of allowing customers to upgrade their card without having to endure a major change to their system infrastructure. To further this aim on-going development is taking place to ensure that:

ChipNet3 continues to operate and communicate with the latest database technologies and features an open database structure.

ChipNet3 continues to be compatible with the most popular ISO contact memory and microprocessor chip technologies in your market

By featuring API structure and keeping pace with similar industry standards, ChipNet3 is continually developed to enhance its integrate- ability with other complimentary 3rd party applications such as:

- Access control
- Time & Attendance
- Payroll & accounting Packages
- ID Badging Systems
- ECR/POS Systems
- Security Systems

Payment Tools

Suppliers of POS systems and specialist software such as network print management or library solutions can integrate their systems with ChipNet using an Infineer serial protocol and the 8652 Payment Terminal. Talk to your Infineer supplier to explore the full range of integration options.
