

Combination Cards

Overview

Where the customer wants his cashless payment card to also be used for Physical Access Control, it is popular to issue a Combination Card which features a standard memory contact chip mounted in a proximity smartcard.

The contact chip provides the transaction security needed by the cashless system and the proximity element provides the speed and ease of use necessary for an effective access control system. Infineer can provide contact chips embedded into many standard proximity cards including Legic, HID and MIFARE

A Combination Card makes the best use of both Contact and Contactless technologies!

For the most powerful and versatile card platform a microprocessor contact chip can also be embedded instead of the standard module. Now your card is truly a multi-application platform allowing you to load complicated applications such as logical access tools and records onto your smart chip along with your ChipNet cashless application.

Talk to your Chipnet3 supplier to find which card suits your requirements and to explore the range of additional features and card accessories that can be provided.
